## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over McGuire (US 5434672) in view of Waldron (US 5982992).

McGuire discloses an error diffusion system and method with which information processing and ink jet printing is accomplished according to combined internal and external super pixel error diffusion techniques. For a particular super pixel, the error amounts of a selected internal subject pixel are provided to another internal subject pixel until a determined or selected final pixel error value within the selected pixel has been determined. The final internal error value is distributed among selected super pixels within a predetermined super pixel neighborhood (abstract).

While McGuire discloses providing pixel data and a super pixel in a matrix of data values, McGuire does not provide pixel data in a given color space and a super pixel in a matrix of color data values indicative of another pixel in another given color space.

However, Waldron discloses an error diffusion system and method in a color ink jet printing apparatus where a source color of input image data is determined and converted to a new or output color gamut for printing (col. 2, line 56 to col. 3, line 3).

It would have been obvious to one of ordinary skill in the art to have modified McGuire for use in a color ink jet printing apparatus as disclosed by Waldron, whereby input pixel data is in a given color space and a super pixel is provided in a matrix of color data values indicative of another pixel in another given color space (for printing), in order to make available for printing, intra-gamut colorants and obtain more realistic halftones and specific colors (see col. 6, lines 17-22 in Waldron).

***Allowable Subject Matter***

Claims 6-10 are allowed.
